1.0. Introduction

ACR1255U-J1 Secure Bluetooth® NFC Reader acts as an interface for the communication between a computer/mobile device and a contactless smart card or NFC-enabled device. It establishes a uniform interface from the computer/mobile device to the smart card for a wide variety of cards. By taking care of the card's particulars, it releases the computer software programmer from being responsible with smart card operations' technical details, which in many cases, are not relevant to the implementation of a smart card system.

1.1. Symbols and Abbreviations

Abbreviation	Description		
ATR	Attribute Request and Attribute Response		
DEP	Data Exchange Protocol Request and Data Exchange Protocol Response		
DSL	Deselect Request and Deselect Response		
PSL Parameter Selection Request and Parameter Selection Response			
RLS	Release Request and Release Response		
WUP Wakeup Request and Wakeup Response			
DID	DID Device ID		
BS Sending bit duration			
BR	Receiving bit duration		
PP Protocol Parameters			

Table 1: Symbols and Abbreviations

2.0. Features

- USB Full Speed Interface
- Bluetooth Smart Interface
- Plug and Play CCID support brings utmost mobility
- USB Firmware Upgradeability¹
- Smart Card Reader:
 - Built-in antenna for contactless tag access, with reading distance of up to 60 mm (depending on tag type)
 - Supports ISO 14443 Part 4 Type A and B cards
 - Supports MIFARE® and MIFARE® DESFire®
 - Supports FeliCa
 - Supports ISO 18092 Tags (NFC Tags)
 - Built-in anti-collision feature (only one tag is accessed at any time)
 - o Supports AES-128 encryption algorithm
 - O NFC Support:
 - Card reader/writer mode
- Application Programming Interface:
 - o Supports PC/SC
 - Supports CT-API (through wrapper on top of PC/SC)
- Supports Android[™] 4.3 and later²
- Supports iOS 5.0 and later³
- Built-in Peripherals:
 - Two user-controllable bi-color LEDs
 - User-controllable buzzer
- Compliant with the following standards:
 - o EN60950/IEC 60950
 - o ISO 18092
 - o ISO 14443
 - Bluetooth Smart
 - o PC/SC
 - o CCID
 - o CE
 - o FCC
 - o RoHS 2
 - o REACH
 - VCCI (Japan)
 - Microsoft® WHQL

¹ Applicable under PC-linked mode

² Uses an ACS-defined Android Library

³ Uses an ACS-defined iOS Library

3.0. System Block Diagram

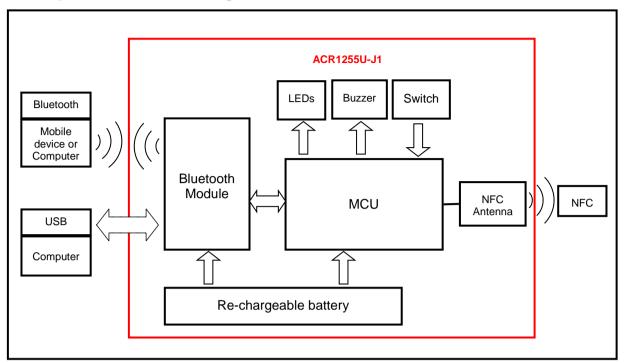

Figure 1: ACR1255U-J1 Architecture

For USB communication architecture, the protocol between ACR1255U-J1 and other devices follow the CCID protocol. All communications for NFC are PC/SC–compliant.

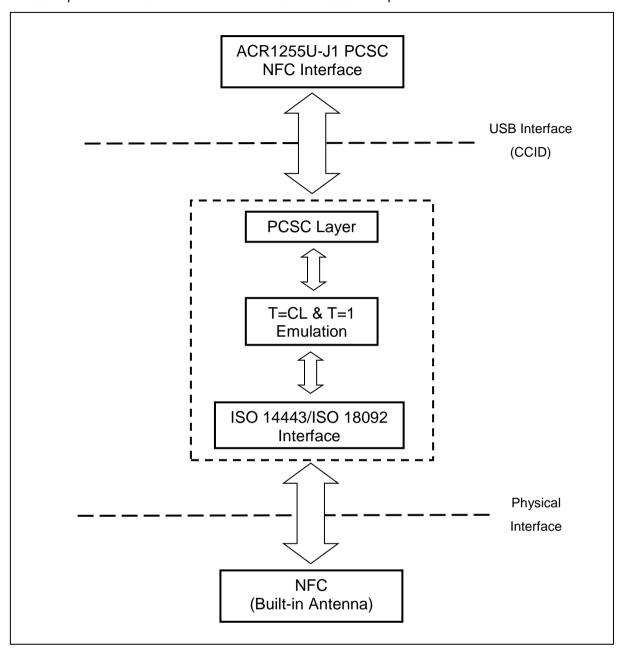

Figure 2: ACR1255U-J1 USB Communication Architecture

Bluetooth Smart protocol stack architecture is as follows:

GAP Peripheral Role Profile	SIM Access Profile	GAP Peripheral Bond Manager	
G	GATT		
	SMP	ATT	
	SIVIP	L2CAP	
Link Layer			
Physical Layer			

Figure 3: Bluetooth Smart Protocol Stack

4.0. Hardware Design

4.1. Battery

ACR1255U-J1 uses a rechargeable Lithium-ion battery, which has a capacity of 320 mAh.

4.1.1. Battery Charging

Once the battery of ACR1255U-J1 runs out, it may be charged in any of the following modes: OFF, USB, Bluetooth; as long as it is connected to a power outlet.

4.1.2. Battery Life

The battery life is dependent on the usage of the device. Below is an estimate of the battery life depending on the various work conditions:

Mode	Estimated Battery Life
Working Mode	10 hours
Standby Mode	21 hours
OFF Mode	8 years

Table 2: Estimated Battery Lifespan

4.2. Bluetooth Interface

ACR1255U-J1 uses Bluetooth Smart as the medium to pair the device with computers and mobile devices.

4.3. USB Interface

The mini USB port is used to connect the ACR1255U-J1 to the computer as battery charging port. This port is also used in order for the ACR1255U-J1 to operate in PC-linked mode.

4.3.1. Communication Parameters

ACR1255U-J1 is connected to a computer through USB as specified in the USB Specification 2.0. The ACR1255U-J1 is working in full speed mode, i.e. 12 Mbps.

Pin	Signal	Function	
1	V_{BUS}	+5 V power supply for the reader	
2	D-	Differential signal transmits data between ACR1255U-J1 and computer	
3	D+	Differential signal transmits data between ACR1255U-J1 and computer	
4	GND	Reference voltage level for power supply	

Table 3: USB Interface Wiring

4.3.2. Endpoints

ACR1255U-J1 uses the following endpoints to communicate with the host computer:

Control Endpoint For setup and control purpose

Bulk OUT For command to be sent from host to ACR1255U-J1

(data packet size is 64 bytes)

Bulk IN For response to be sent from ACR1255U-J1 to host

(data packet size is 64 bytes)

Interrupt IN For card status message to be sent from ACR1255U-J1 to host

(data packet size is 8 bytes)

4.4. NFC Interface

The interface between ACR1255U-J1 and contactless card follows the ISO 14443 or ISO 18092 specifications with certain restrictions or enhancements aimed to increase the practical functionality of the reader.

4.4.1. Carrier Frequency

The carrier frequency of ACR1255U-J1 is 13.56 MHz

4.4.2. Card Polling

ACR1255U-J1 automatically polls the contactless cards that are within the field. ISO 14443-4 Type A, ISO 14443 Type B, FeliCa, Topaz, MIFARE, and NFC tags are supported.

4.5. User Interface

4.5.1. Keys

ACR1255U-J1 has 3 keys with locations shown in the figure below:

Key	Description
ANT_KEY	Wake up from sleep mode
MODEL_KEY	Mode selection
UPDATE_KEY	Enable boot loader

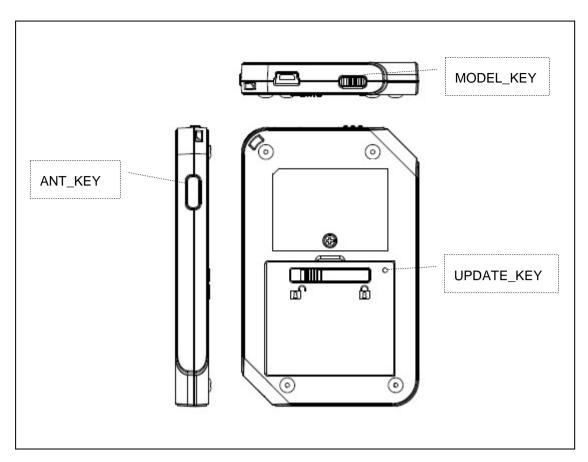

Figure 4: Keys on ACR1255U-J1

4.5.2. Mode Selection Switch

ACR1255U-J1 has three modes: USB, Off and Bluetooth. User can select one mode at a time as a data transmission interface.

Symbol	Switch	Active Mode
USB	USB	PC-linked
0	Off	No power
*	Bluetooth	Bluetooth

4.5.3. Status LED

ACR1255U-J1 has two bi-color LEDs to show the various operation statuses, where:

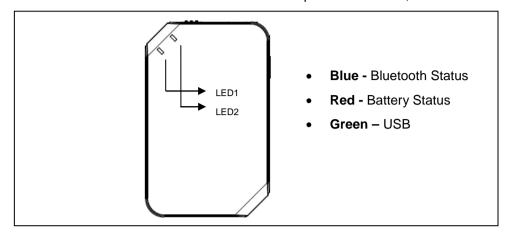

Figure 5: LED Operation Status

Mode	Color	LED Activity	Status
	Off No Bluetooth de Reader is in US Slow flash v14 The paired Blue	Off	Reader is powered off No Bluetooth device paired Reader is in USB mode
		The paired Bluetooth device is authenticated successfully and is waiting for instructions	
	Blue (LED1)	Slow flash v2 ⁵	Bluetooth device is paired, card polling is on and no card is present Data is being transferred between the reader and paired device
	, ,	Fast flash	Data is being transferred between the reader and paired device
Bluetooth Mode		Fast – Slow flash	Powered on Searching for devices to be paired with
		On	Bluetooth device is paired with the reader Card is present
		Off	Battery is fully charged Reader is powered off The voltage of the battery is greater than 3.5 V and no USB powered is being supplied
		Slow flash	Low battery
		On	Battery is charging
		Off	Reader is powered off
	Green (LED2)	Slow flash	No card presented and the reader is waiting for instruction
USB mode		Fast flash	There is read/write access between the smart card and reader
		On	Card is present and the reader is waiting for instruction
	Orange ⁶ (LED2)	On	Device is powered on

⁴ LED is on for 500 ms, off for 500 ms

 $^{^{\}rm 5}$ LED is on for 200 ms, off for 1800 ms

⁶ Green and Red both turned on

Mode	Color	LED Activity	Status
Red (LED1)	Off	Battery is fully charged Reader is powered off The voltage of the battery is greater than 3.5V and no USB powered is being supplied	
	, ,	Slow flash	Low battery
		On	Battery is charging

4.5.4. Buzzer

ACR1255U-J1 has a buzzer that is used to notify user of card polling, Bluetooth connection, sleep mode, and low-battery status.

Buzzer Activity	Event
One short beep	Card has been detected or removed
One long beep	Reader has been powered on

5.0. Software Design

5.1. Bluetooth Connection Flow

The program flow of the Bluetooth connection is shown below:

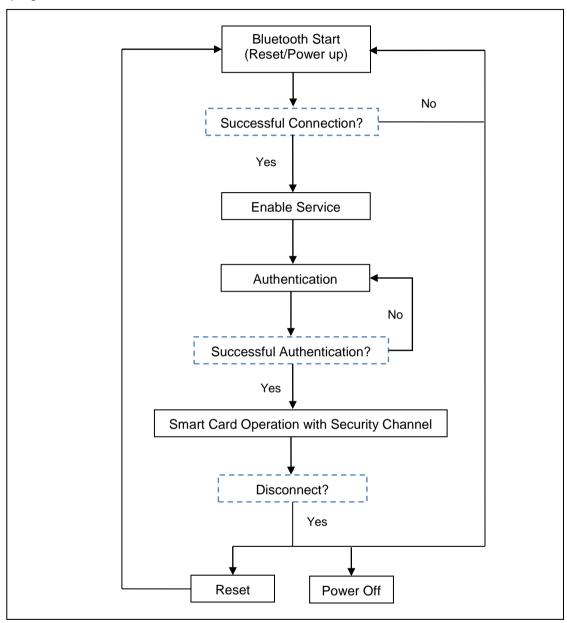

Figure 6: Bluetooth Connection Flow

5.2. Profile Selection

ACR1255U-J1 is a smart card reader that is designed to use Bluetooth technology as an interface to transmit data. A customized service called Commands Communication with three pipes is used: one pipe is used for command request, the second pipe is for command response/card notification, and third is RFU.

Also, the reader's current power consumption is significantly greater when the reader is operating in Bluetooth mode, hence, a standard battery service is used to notify the paired device about the current battery status. When there is a change in the battery status, the reader will notify the paired device through a specific pipe. To simplify, the battery levels are divided into three groups: sufficient battery ($\geq 3.78 \text{ V}$), low battery ($\leq 3.78 \text{ V}$), and no battery ($\leq 3.68 \text{ V}$).

Finally, to provide more reader information to the user, a customized Device Information service is added. This can only be read manually, or by an application request. The characteristics include Model Number, Serial Number, Firmware Revision, and Manufacturer Name.

Service	UUID	Pipe
	FFF1	Commands Request
Smart Card	FFF2	Commands Response/Card Notification
	FFF3	RFU
Battery	2A19	Battery Level
	2A23	System ID
	2A24	Model Number
Device Information	2A25	Serial Number
Device information	2A26	Firmware Revision
	2A27	Hardware Revision
	2A29	Manufacturer Name

Table 4: ACR1255U-J1's Bluetooth Service

Attribute Name	UUID	Handle
DeviceName	2A00	03h
Send(Reader → Paired device)	8002	0Bh
Receive(Paired device → Reader)	8003	0Eh
CardStatus	8004	10h
BatteryLevel	2A19	14h
Manufacturer	2A29	18h
SerialNumber	2A25	21h
FW_Version	2A26	1Bh
ModelNumber	2A24	1Eh

Table 5: ACR1255U-J1 Service Handles and UUID Information List

5.3. Authentication

Before any sensitive data can be loaded into ACR1255U-J1, the data processing server must be authenticated by ACR1255U-J1 for the privilege to modify the secured data inside reader. In ACR1255U-J1, a mutual authentication method is being used.

An authentication request is always initiated by either the data processing server or the bridging device, which will then trigger ACR1255U-J1 to return a sequence of 16 bytes of random numbers (RND_A[0:15]). The random numbers are encrypted with the Customer Master Key currently stored in ACR1255U-J1 using the AES-128 CBC ciphering mode before being sent out from ACR1255U-J1. The bridging device must pass this sequence of encrypted random numbers to the data processing server, which will then undergo AES-128 CBC cipher mode decryption using the Customer Master Key that is being used in the data processing server (which should be the same as the one that is being used in ACR1255U-J1 and should be kept securely by the customer). The 16 bytes of decrypted random numbers from ACR1255U-J1 is then padded to the end of another 16 bytes of random numbers generated by the data processing server (RND_B[0:15]). The final sequence of 32 bytes of random numbers (RND_C[0:31]), that is:

$RND_C[0:31] = RND_B[0:15] + RND_A[0:15],$

will undergo decryption operation with the Customer Master Key being used in the server and the final output data is sent to ACR1255U-J1 through the bridging device using an authentication response message.

When ACR1255U-J1 receives the authentication response message, the message data will undergo an encryption operation using its own Customer Master Key and will be converted back to the normal 32 bytes of random numbers. In theory, the first 16 bytes of random numbers should be equal to RND_B[0:15] and are generated by the data processing server while the other 16 bytes should be equal to RND_A[0:15] and are originally generated by ACR1255U-J1.

ACR1255U-J1 will first compare if RND_A[0:15] is the same as the original version. If it is the same, then the data processing server is authenticated by ACR1255U-J1. ACR1255U-J1 will then encrypt RND_B[0:15] obtained using the Customer Master Key and the feedback to the data processing server through the bridging device using the answer to the authentication response message.

Upon receiving the answer to the authentication response message, the data processing server will decrypt the data contained in the message and check if the 16 bytes of random numbers are all equal to those originally generated RND_B[0:15]. If they are the same, then ACR1255U-J1 is authenticated by the server. At this moment, the whole authentication process is completed and sensitive data can be injected into ACR1255U-J1.

After successful authentication, a 16-byte Session Key is generated in both ACR1255U-J1 and the data processing server. The Session Key (SK[0:15]) is obtained by padding the first 8 bytes of RND_B at the end of the first 8 bytes of RND_A, that is:

$SK[0:15] = RND_A[0:7] + RND_B[0:7]$

All sensitive data leaving out of the Secured Data Processing Server must be encrypted with this Session Key using the AES-128 CBC ciphering mode. Thus, even if the encrypted data may be captured in the bridging mobile device, it is still very difficult to retrieve the original sensitive data without any prior knowledge of the Customer Master Key.

For better illustration, please refer to figure below (the picture below has omitted the bridging device for simplicity and better illustration):

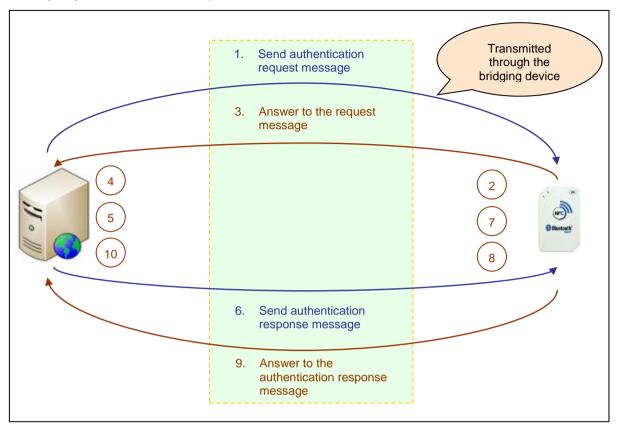

Figure 7: Authentication Procedure

Below is a summary of the above mentioned steps:

- 1. The data processing server/bridging device initiates an authentication request from ACR1255U-J1 by issuing an authentication request message.
- 2. Upon receiving the authentication request message, ACR1255U-J1 will generate 16 bytes of random numbers (RND_A[0:15]). The whole 16 bytes of data is encrypted with the Customer Master Key currently being used by ACR1255U-J1.
- 3. The encrypted version of RND_A[0:15] is then transferred to the data processing server through the answer to the authentication response message.
- 4. The data processing server will decrypt the data received to recover RND_A[0:15].
- 5. The data processing server will generate another 16 bytes of random numbers (RND_B[0:15]). RND_A[0:15] will be padded to the end of RND_B[0:15] to form a sequence of 32-byte random numbers (RND_C[0:31] = RND_B[0:15] + RND_A[0:15]). All the 32 bytes of random numbers will undergo a decryption process with the Customer Master Key currently being used in the server.
- 6. The final output data from the encryption process will be transferred to ACR1255U-J1 through the authentication response message.
- 7. In ACR1255U-J1, an encryption process will be performed on the received data to recover the 32 bytes of random number. ACR1255U-J1 will check the result RND_A[0:15] to see if they are the same as the original ones. If not, the authentication process will be terminated.
- 8. ACR1255U-J1 will encrypt the resultant RND_B[0:15] with the Customer Master Key. At the same time, a 16-byte Session Key is created by padding the first 8 bytes of RND_B to the end of the first 8 bytes of RND_A.

- 9. The encrypted RND_B[0:15] will be transferred to the data processing server through the authentication response message.
- 10. The data processing server will decrypt the message data and compare if the content is equal to the original RND_B[0:15]. If not, the authentication process will be terminated. Otherwise, the authentication process is completed and a 16-byte Session Key is created by padding the first 8 bytes of RND_B to the end of the first 8 bytes of RND_A.

Unidirectional authentication should be used to establish the binding between ACR1255U-J1 and the paired device. ACR1255U-J1 acts as a peripheral wherein it waits until the device to be paired with establishes a connection. The device to be paired with will need to send a PIN to complete the authentication process. By default, the PIN value is 000000.

5.4. Communication Profile

The communication profile should be:

Start byte + Len + Datablock + Check + Stop byte

Field	Size (bytes)	Description
Start byte	1	Value: 05h
Len	2	Len means the number of bytes in the Datablock field
Datablock	N	Data (the frame format is described in Frame Format)
Check	1	Check means the XOR values of bytes in Len and Datablock fields
Stop byte	1	Value: 0Ah

5.5. Frame Format

5.5.1. Data Frame Format

Command

HID Frame	Length (bytes)	Description
CmdMessagType	1	Commands
Length	2	Data length
Slot	1	Default value: 00h
Seq	1	Sequence
Param	1	Parameter
Check	1	Checksum
Data	0-N	Data

The frame format should be:

CmdMessageType + Length + Slot + Seq + Param + Check + Data

If the total command length, including identifier, length and payload, is greater than 20 bytes, then the reader or the paired device will automatically divide it into several frames.

Response

HID Frame	Length (bytes)	Description
RspMessagType	1	Commands
Length	2	Data length
Slot	1	Default value: 00h
Seq	1	Sequence
Slot Status/Param	1	Slot Status/Parameter
Checksum	1	Checksum
Data	0-N	Data

Data checksum is used in detecting errors that may have been introduced during wireless data transmission. To calculate the data checksum: XOR {RspMessageType, Length, Slot, Seq, SlotStatus/Param, Data}.

Example: 62010063 => Checksum = 63h

5.6. Bluetooth Communication Protocol

ACR1255U-J1 communicates to the paired device using the Bluetooth interface with a predefined protocol. The protocol is similar to the formats of the CCID Command Pipe and Response Pipe.

Command	Mode Supported	Sender	Description
62h	Authenticated	Paired device	PICC Power On
63h	Authenticated	Paired device	PICC Power Off
65h	Authenticated	Paired device	Get Card Status
6Fh	Authenticated	Paired device	Exchange APDU
6Bh	Authenticated	Paired device	Escape Commands

Table 6: Command Code Summary

Command	Mode Supported	Sender	Description
80h	Authenticated	Reader	Response to Data Block
81h	Authenticated	Reader	Response to Slot Status
83h	Authenticated	Reader	Response to Escape Command
50h	Authenticated	Reader	Notify Card Status
51h	Authenticated	Reader	Response to Hardware Error

Table 7: Response Code Summary

5.6.1. Card Power On

This command sends a power on request to the reader.

Command Format

Offset	Field	Size	Value	Description
0	CmdMessageType	1	62h	-
1	Length	2	00 00h	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	00h	Parameter
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

Response Data Format

Offset	Field	Size	Value	Description
0	CmdMessageType	1	80h	-
1	Length	2	-	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	00h	Parameter
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

Example:

Response = 80 00 08 00 00 00 3B 3B 83 80 01 41 07 00 44

ATR = 3B 83 80 01 41 07 00 44

5.6.2. Card Power Off

This command sends a power off request to the reader.

Command Format

Offset	Field	Size	Value	Description
0	CmdMessageType	1	63h	-
1	Length	2	00 00h	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	00h	Parameter
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

Offset	Field	Size	Value	Description
0	CmdMessageType	1	81h	-
1	Length	2	-	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	00h	Parameter
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

5.6.3. Get Slot Status

This command checks the presence of the inserted card.

Command Format

Offset	Field	Size	Value	Description
0	CmdMessageType	1	65h	-
1	Length	2	00 00h	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	00h	Parameter
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

Offset	Field	Size	Value	Description
0	CmdMessageType	1	81h	-
1	Length	2	00 00h	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	-	Card Status: 00h = Card present and active 01h = Card present but inactive 02h = Card absent
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

5.6.4. APDU Command

This command sends an APDU command to the reader.

Command Format

Offset	Field	Size	Value	Description
0	CmdMessageType	1	6Fh	-
1	Length	2	-	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	00h	Parameter
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

Offset	Field	Size	Value	Description
0	CmdMessageType	1	80h	-
1	Length	2	-	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	00h	Parameter
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

5.6.5. Notify Card Status Command

This command checks the card status.

Offset	Field	Size	Value	Description	
0	CmdMessageType	1	50h	-	
1	Length	2	00 00h	Data length	
3	Slot	1	00h	-	
4	Seq	1	00h	Sequence	
5	Param	1	-	Status: 02h = Card present 03h = Card absent 04h = Reader has entered sleep mode	
6	Check	1	-	Check means the XOR values of all bytes in the command	
7	Data	N	-	Data	

Note: If command "52 00 00 00 00 01 XX" is received, this have the same meaning with "50 00 00 00 00 00 4 XX" (Reader has entered sleep mode).

5.6.6. Hardware Error Response

This command checks the hardware error status.

Offset	Field	Size	Value	Description
0	CmdMessageType	1	51h	-
1	Length	2	-	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	-	Status: 01h = Checksum error 02h = Timeout 03h = Command error 04h = Unauthorized 05h = Undefined error 06h = Receive data error
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

5.6.7. Escape Command

This command allows access to the extended features of the reader.

5.6.7.1. For PC-linked Mode

Command Format

Offset	Field	Size	Value	Description
0	CmdMessageType	1	6Bh	-
1	Length	2	-	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	00h	Parameter
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

Response Data Format

Offset	Field	Size	Value	Description
0	CmdMessageType	1	83h	-
1	Length	2	-	Data length
3	Slot	1	00h	-
4	Seq	1	00h	Sequence
5	Param	1	00h	Parameter
6	Check	1	-	Check means the XOR values of all bytes in the command
7	Data	N	-	Data

5.6.7.2. For Bluetooth Mode

1. Open automatic polling

Request command: E0 00 00 40 01 Response command: E1 00 00 40 01

Example:

Request: 6B 00 05 00 00 00 A1 E0 00 00 40 01 Response: 83 00 05 00 00 00 E1 E1 00 00 40 01

2. Close automatic polling

Request command: E0 00 00 40 00 Response command: E1 00 00 40 00

Example:

Request: 6B 00 05 00 00 00 A1 E0 00 00 40 00 Response: 83 00 05 00 00 00 E1 E1 00 00 40 00

3. Change PIN of ACR1255U-J1

Note: To use a new PIN, the device should reboot.

Request command: E0 00 00 E0 11 + PINKey(3bytes)

Where: PINKey = 3 bytes, in decimal

e.g., PINKey in ASCII: 010203

PINKey in decimal: 01 02 03

Response command: E1 00 00 E0 11

Example:

Request to change PIN to 000001: 6B 00 08 00 00 00 10 E0 00 00 E0 11 00 00 01

Response: 83 00 05 00 00 02 10 E1 00 00 E0 11

4. Authentication request

Request command: E0 00 00 45 00

Response command: E1 00 00 45 00 + Data(16 bytes)

Where: Data = 16 bytes of random numbers

Example:

Request (SPH_to_RDR_ReqAuth): 6B 00 05 00 00 00 CB E0 00 00 45 00

Response (RDR_to_SPH_AuthRsp1): 83 00 15 00 00 02 2C E1 00 00 45 00 77 59 E8 62 B7 80 0D 0A CE 9A 03 9B E9 48 EF 05

5. Authentication response

Request command: E0 00 00 46 00 + Data (32 bytes)

Response command: E1 00 00 46 00/01 + Data(16 bytes)

Example:

Request (SPH_to_RDR_AuthRsp): 6B 00 25 00 00 00 EA E0 00 00 46 00 A6 81 17 91 9F 46 07 AE AE 4E 94 8E 05 14 E8 C8 25 F7 90 05 76 F8 DE 7D 6D ED 55 3F 80 10 C2 CA

Response (RDR_to_SPH_AuthRsp2): 83 00 15 00 00 02 53 E1 00 00 46 00 47 D5 50 54 F3 49 D4 17 B1 65 40 21 9B DA C9 B2

5.7. Mutual Authentication and Encryption Protocol

In Bluetooth mode, the <u>Bluetooth Communication Protocol</u> will be encrypted and transmitted after a successful mutual authentication.

5.7.1. Bluetooth Authentication Program Flow

As illustrated in <u>Authentication</u>, mutual authentication is being used to avoid man-in-the-middle attack. The summary of the commands used in mutual authentication is in the following table:

Sequence	Command	Mode Supported	Sender	Description
1	6Bh	Connected	Paired device	SPH_to_RDR_ReqAuth
2	83h	Connected	Reader	RDR_to_SPH_AuthRsp1
3	6Bh	Connected	Paired device	SPH_to_RDR_AuthRsp
4	83h	Connected	Reader	RDR_to_SPH_AuthRsp2

Table 8: Summary of Mutual Authentication Commands

The 16-byte Session Key, SK[0:15,] is generated in both ACR1255U-J1 and the data processing server. It is obtained by padding the first 8 bytes of RND_B at the end of the first 8 bytes of RND_A, i.e.

$$SK[0:15] = RND_A[0:7] + RND_B[0:7]$$

5.7.2. SPH_to_RDR_ReqAuth

This command will request ACR1255U-J1 to perform authentication with the paired key-generating device.

For more information on the authentication process, please refer to **Authentication**.

Offset	Field	Size	Value	Description	Encrypted
0	bMessageType	1	6Bh	-	
1	LEN1 LEN2 (wLength)	2	00 05h	The Number of extra bytes in Data field, and is expressed in two bytes long, and LEN1 is MSB while LEN2 is LSB;	
3	Slot Number	1	00h	-	No
4	Sequence	1	00h	-	
5	Parameter	1	00h	Slot Status	
6	wChecksum	1	CBh	CSUM means the XOR values of all bytes in the command	
7	Data	5	E0 00 00 45 00h	-	No

The response to this message is RDR_to_SPH_AuthRsp1 if the received command message is error-free. Otherwise, the response message will be RDR_to_SPH_ACK to provide the error information.

5.7.3. RDR_to_SPH_AuthRsp1

This command is sent by ACR1255U-J1 in response to the SPH_to_RDR_ReqAuth.

Offset	Field	Size	Value	Description	Encrypted
0	bMessageType	1	83h	-	No
1	LEN1 LEN2 (wLength)	2	00 15h	Number of extra bytes in abRndNum field, and is expressed in two bytes long, and LEN1 is MSB while LEN2 is LSB;	No
3	Slot Number	1	00h	-	No
4	Sequence	1	00h	-	No
5	Parameter	1	00h	Slot Status	
6	wChecksum	1	-	wChecksum means the XOR values of all bytes in the command	No
7	abRndNum	21	E1 00 00 45 00 + 16 bytes random number	abRndNum[0:15] – 16 bytes of random number All the 16-byte data must be encrypted with the Customer Master Key currently stored in ACR1255U-J1. "E1 00 00 45 00" does not need to be encrypted.	Yes

5.7.4. SPH_to_RDR_AuthRsp

This command is the second phase of the authentication process. After the device has initiated the SPH_to_RDR_ReqAuth command to the ACR1255U-J1, the reader will then provide an RDR_to_SPH_AuthRsp1 message if there's no error.

The RDR_to_SPH_AuthRsp1 will contain a sequence of 16-byte random numbers encrypted using the Customer Master Key. The paired key-generating device should decrypt it using the correct Customer Master Key and pads it to the end of the 16-byte random numbers. The overall 32-byte random numbers will be decrypted using the Customer Master Key and returned to ACR1255U-J1 using this command in order to have a successful authentication.

Offset	Field	Size	Value	Description	Encrypted
0	bMessageType	1	6Bh	-	No
1	LEN1 LEN2 (wLength)	2	00 25h	The Number of extra bytes in the abAuthData field, and is expressed in two bytes long, and LEN1 is MSB while LEN2 is LSB;	No
3	Slot Number	1	00h	-	No
4	Sequence	1	00h	-	No
5	Parameter	1	00h	Slot Status	No
6	wCheckSum	1	-	wCheckSum means the XOR values of all bytes in the command	No
7	abAuthData	37	E0 00 00 46 00 + 32 bytes random number	abAuthData[0:15] – 16 bytes of random number generated by the data processing server abAuthData[16:31] – 16 bytes of decrypted random number received from ACR1255U-J1 All the 32 bytes of data underwent a decryption process with the Customer Master Key using AES128 CBC cipher mode. "E0 00 00 46 00" does not need to be decrypted.	Yes

The response to this message is RDR_to_SPH_AuthRsp2 if the command message received is error-free and the random number generated returned by paired device is correct. Otherwise, the response message will be RDR_to_SPH_ACK to provide the error information.

5.7.5. RDR_to_SPH_AuthRsp2

This command is sent by ACR1255U-J1 in response to the SPH_to_RDR_AuthRsp.

Offset	Field	Size	Value	Description	Encrypted
0	bMessageType	1	83h	-	No
1	LEN1 LEN2 (wLength)	2	00 15h	Number of extra bytes in abRndNum field, and is expressed in two bytes long, and LEN1 is MSB while LEN2 is LSB;	No
3	Slot Number	1	00h	-	No
4	Sequence	1	00h	-	No
5	Parameter	1	00h	Slot Status	No
6	wCheckSum	1	-	-	No
20	abRndNum	21	E1 00 00 46 00 + 16 bytes random number	abRndNum[0:15] – 16 bytes of random number retrieved from the data processing server All the 16-byte data must be encrypted with the Customer Master Key that is currently stored in ACR1255U- J1 "E1 00 00 46 00" does not need to be encrypted.	Yes

5.7.6. RDR_to_SPH_ACK (Error handling)

This is an error handling acknowledgement message sent by the ACR1255U-J1 to the paired device to recognize the acceptance of some command messages. During the communication, any indicated error message will be transmitted using the RDR_to_SPH_ACK. The command is not encrypted.

Command	Mode supported	Sender	Description
51h	Connected, Authenticated	Reader	RDR_to_SPH_ACK (Error handling)

This message will also include the error code whenever appropriate.

Offset	Field	Size	Value	Description	Encrypted	
0	bMessageType	essageType 1 51h Error handling response header				
1	LEN1LEN2 (wLength)	2	00 00h	-		
3	Slot Number	1	00h	-		
4	Sequence 1		00h	-		
3	bErrorCode	1 -		Specify the error code for the previously processed command message. The possible error codes are listed in as the table below.	No	
4	wChecksum	1	-	CSUM means the XOR values of all bytes in the command		

Field	Value	Description	
	01h	Checksum error	
	02h	Timeout	
bErrorCode	03h	Command error	
bErrorCode	04h	Unauthorized	
	05h	Undefined error	
	06h	Received data error	

Table 9: Mutual Authentication Error codes

6.0. Host Programming (PC-linked) API

6.1. PC/SC API

This section describes some of the PC/SC API for application programming usage. For more details, please refer to Microsoft MSDN Library or PC/SC workgroup.

6.1.1. SCardEstablishContext

The SCardEstablishContext function establishes the resource manager context within which database operations are performed.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379479%28v=vs.85%29.aspx

6.1.2. SCardListReaders

The SCardListReaders function provides the list of readers within a set of named reader groups, eliminating duplicates.

The caller supplies a list of reader groups, and receives the list of readers within the named groups. Unrecognized group names are ignored. This function only returns readers within the named groups that are currently attached to the system and available for use.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379793%28v=vs.85%29.aspx

6.1.3. SCardConnect

The *SCardConnect* function establishes a connection (using a specific resource manager context) between the calling application and a smart card contained by a specific reader. If no card exists in the specified reader, an error is returned.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379473%28v=vs.85%29.aspx

6.1.4. SCardControl

The *SCardControl* function gives you direct control of the reader. You can call it any time after a successful call to *SCardConnect* and before a successful call to *SCardDisconnect*. The effect on the state of the reader depends on the control code.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379474%28v=vs.85%29.aspx

Note: Commands from <u>Peripherals Control</u> are using this API for sending.

6.1.5. ScardTransmit

The SCardTransmit function sends a service request to the smart card and expects to receive data back from the card.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379804%28v=vs.85%29.aspx

Note: APDU Commands (i.e. the commands sent to connected card and <u>Pseudo APDU for Contactless Interface</u>) are using this API for sending.

6.1.6. ScardDisconnect

The **SCardDisconnect** function terminates a connection previously opened between the calling application and a smart card in the target reader.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379475%28v=vs.85%29.aspx

6.1.7. APDU Flow

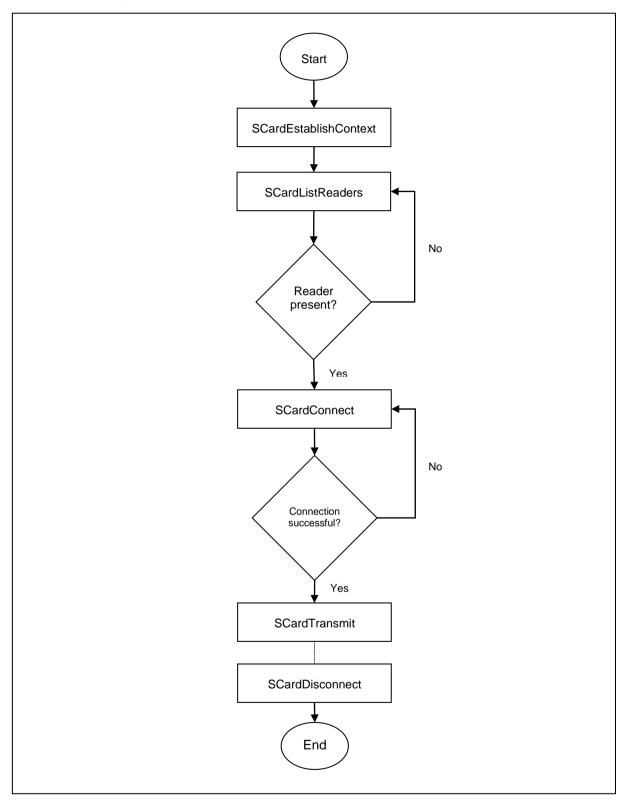

Figure 8: ACR1255U-J1 APDU Flow

6.1.8. Escape Command Flow

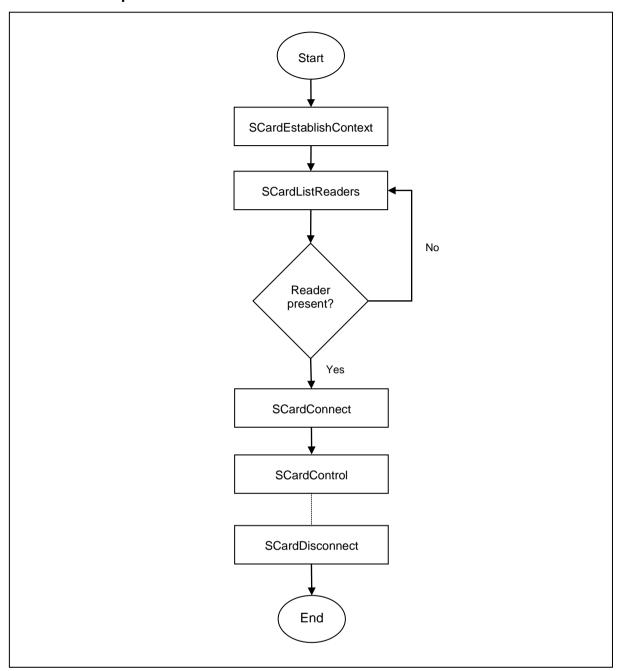

Figure 9: ACR1255U-J1 Escape Command Flow

6.2. Contactless Smart Card Protocol

6.2.1. ATR Generation

If the reader detects a PICC, an ATR will be sent to the PCSC driver for identifying the PICC.

6.2.1.1. ATR Format for ISO 14443 Part 3 PICCs

Byte	Value	Designation	Description
0	3Bh	Initial Header	-
1	8Nh	ТО	Higher nibble 8 means: no TA1, TB1, TC1 only TD1 is following. Lower nibble N is the number of historical bytes (HistByte 0 to HistByte N-1)
2	80h	TD1	Higher nibble 8 means: no TA2, TB2, TC2 only TD2 is following. Lower nibble 0 means T = 0
3	01h	TD2	Higher nibble 0 means no TA3, TB3, TC3, TD3 following. Lower nibble 1 means T = 1
	80h	T1	Category indicator byte, 80 means A status indicator may be present in an optional COMPACT-TLV data object.
4	4Fh		Application identifier Presence Indicator.
	0Ch		Length
to	RID	Tk	Registered Application Provider Identifier (RID) # A0 00 00 03 06
3+N	SS		Byte for standard.
	C0 C1h		Bytes for card name.
	00 00 00 00h	RFU	RFU # 00 00 00 00
4+N	UU	TCK	Exclusive-oring of all the bytes T0 to Tk

Example:

ATR for MIFARE Classic 1K = {3B 8F 80 01 80 4F 0C A0 00 00 03 06 03 00 01 00 00 00 06 Ah}

Where:

Length (YY) = 0Ch

RID = A0 00 00 03 06h (PC/SC Workgroup)

Standard (SS) = 03h (ISO 14443A, Part 3) **Card Name (C0 .. C1)** = [00 01h] (MIFARE Classic 1K)

Standard (SS) = 03h: ISO 14443A, Part 3

= 11h: FeliCa

Card Name (C0 .. C1)

00 01: MIFARE Classic 1K 00 02: MIFARE Classic 4K 00 03: MIFARE Ultralight 00 38: MIFARE Plus SL2 2K 00 39: MIFARE Plus SL2 4K 00 30: Topaz and Jewel

00 26: MIFARE Mini 00 3B: FeliCa 00 3A: MIFARE Ultralight C FF 28: JCOP 30

00 36: MIFARE Plus SL1 2K FF [SAK]: undefined tags

00 37: MIFARE Plus SL1 4K

6.2.1.2. ATR Format for ISO 14443 Part 4 PICCs

Byte	Value	Designation	Description				
0	3Bh	Initial Header	-				
1	8N	ТО	Higher nibble 8 means: no TA1, TB1, TC1 only TI is following. Lower nibble N is the number of historical byte (HistByte 0 to HistByte N-1)				
2	80h	TD1	Higher nibble 8 means: no TA2, TB2, TC2 only TD2 is following. Lower nibble 0 means T = 0				
3	01h	TD2	Higher nibble 0 means no TA3, TB3, TC3, TD3 following. Lower nibble 1 means T = 1				
	XX	T1	Historical Bytes:				
4 to	XX		ISO 14443-A: The historical bytes from ATS response. Refer to the ISO 14443-4 specification. ISO 14443-B: Byte1-4 Byte5-7 Byte8				
3 + N	to		Application Data from ATQB AT				
4+N	UU	TCK	Exclusive-oring of all the bytes T0 to Tk				

Example 1:

ATR for MIFARE DESFire = {3B 81 80 01 80 80h} // 6 bytes of ATR

Note: Use the APDU "FF CA 01 00 00h" to distinguish the ISO 14443A-4 and ISO 14443B-4 PICCs, and retrieve the full ATS if available. ISO 14443A-3 or ISO 14443B-3/4 PICCs do have ATS returned.

APDU Command = FF CA 01 00 00h APDU Response = 06 75 77 81 02 80 90 00h ATS = {06 75 77 81 02 80h}

Example 2:

ATR for EZ-link = {3B 88 80 01 1C 2D 94 11 F7 71 85 00 BEh}

Application Data of ATQB = 1C 2D 94 11h

Protocol Information of ATQB = F7 71 85h

MBLI of ATTRIB = 00h

6.3. Pseudo APDU for Contactless Interface

6.3.1. Get Data

This command returns the serial number or ATS of the "connected PICC".

Get UID APDU Format (5 bytes)

Command	Class	INS	P1	P2	Le
Get Data	FFh	CAh	00h	00h	00h
Oct Data	FFII	CAII	01h	OUN	(Max. Length)

If P1 = 00h, Get UID Response Format (UID + 2 bytes)

Response			Data	a Out		
Result	UID (LSB)	-	-	UID (MSB)	SW1	SW2

If P1 = 01h, Get ATS of a ISO 14443 A card (ATS + 2 bytes)

Response		t	
Result	ATS	SW1	SW2

Response Codes

Results	SW1	SW2	Meaning
Successful	90h	00h	The operation is completed successfully.
Warning	62h	82h	End of UID/ATS reached before Le bytes (Le is greater than UID Length).
Error	6Ch	XX h	Wrong length (wrong number Le: 'XX' encodes the exact number) if Le is less than the available UID length.
Error	63h	00h	The operation is failed.
Error	6Ah	81h	Function not supported

Examples:

To get the serial number of the "connected PICC":

UINT8 $GET_UID[5] = \{FF, CA, 00, 00, 00\};$

To get the ATS of the "connected ISO 14443 A PICC":

UINT8 GET_ATS[5] = {FF, CA, 01, 00, 00};

6.4. PICC Commands for MIFARE® Classic (1K/4K) memory cards

6.4.1. Load Authentication Keys

This command loads the authentication keys to the reader. The authentication keys are used to authenticate the particular sector of the MIFARE Classic (1K/4K) memory card.

Load Authentication Keys APDU Format (11 bytes)

Command	Class	INS	P1	P2	Lc	Data In
Load Authentication Keys	FFh	82h	Key Structure	Key Number	06h	Key (6 bytes)

Where:

Key Structure 1 byte.

00h = Key is loaded into the reader volatile memory.

Other = Reserved.

Key Number 1 byte.

00h ~ 01h = Volatile memory for storing a temporary key. The key will disappear once the reader is disconnected from the computer. Two volatile keys are provided. The volatile key can be used as a session key for different appoints.

for different sessions.

Note: The default value is FF FF FF FF FFh.

Key 6 bytes.

The key value loaded into the reader. Example: FF FF FF FF FF FF

Load Authentication Keys Response Format (2 bytes)

Response	Data Out			
Result	SW1	SW2		

Load Authentication Keys Response Codes

Results	SW1	SW2	Meaning
Successful	90h	00h	The operation is completed successfully.
Error	63h	00h	The operation is failed.

Example:

// Load a key {FF FF FF FF FF FFh} into the volatile memory location 00h.

APDU = {FF 82 00 00 06 FF FF FF FF FF FFh}

6.4.2. Authentication for MIFARE® Classic (1K/4K)

This command uses the keys stored in the reader to do authentication with the MIFARE Classic (1K/4K) card (PICC). Two types of authentication keys are used: TYPE_A and TYPE_B.

Load Authentication Keys APDU Format (6 bytes) [Obsolete]

Command	Class	INS	P1	P2	Р3	Data In
Authentication	FFh	88h	00h	Block Number	Key Type	Key Number

Load Authentication Keys APDU Format (10 bytes)

Command	Class	INS	P1	P2	Lc	Data In
Authentication	FFh	86h	00h	00h	05h	Authenticate Data Bytes

Authenticate Data Bytes (5 bytes)

Byte1	Byte 2	Byte 3	Byte 4	Byte 5
Version 01h	00h	Block Number	Key Type	Key Number

Where:

Block Number

1 byte. The memory block to be authenticated.

For MIFARE Classic 1K card, it has a total of 16 sectors and each sector consists of four consecutive blocks (e.g., Sector 00h consists of blocks {00h, 01h, 02h and 03h}); sector 01h consists of blocks {04h, 05h, 06h and 07h}; the last sector 0Fh consists of blocks {3Ch, 3Dh, 3Eh and 3Fh}. Once the authentication is done successfully, there is no need to do the authentication again provided that the blocks to be accessed belong to the same sector. Please refer to the MIFARE Classic (1K/4K) specification for more details.

Note: Once the block is authenticated successfully, all the blocks belonging to the same sector are accessible.

Key Type

1 byte.

60h = Key is used as a TYPE A key for authentication.

61h = Key is used as a TYPE B key for authentication.

Key Number

1 byte.

 $00 \sim 01h$ = Volatile memory for storing keys. The keys will disappear when the reader is disconnected from the computer. Two volatile keys are provided. The volatile key can be used as a session key for different sessions.

Load Authentication Keys Response Format (2 bytes)

Response	Data Out			
Result	SW1	SW2		

Load Authentication Keys Response Codes

Results	SW1	SW2	Meaning		
Successful	90	00h	The operation is completed successfully.		
Error	63	00h	The operation is failed.		

Sectors (Total 16 sectors. Each sector consists of 4 consecutive blocks)	Data Blocks (3 blocks, 16 bytes per block)	Trailer Block (1 block, 16 bytes)
Sector 0	00h – 02h	03h
Sector 1	04h – 06h	07h
:		
Sector 14	38h – 0Ah	3Bh
Sector 15	3Ch – 3Eh	3Fh

Table 10: MIFARE® Classic 1K Memory Map

Sectors (Total 32 sectors. Each sector consists of 4 consecutive blocks)	Data Blocks (3 blocks, 16 bytes per block)	Trailer Block (1 block, 16 bytes)	
Sector 0	00h – 02h	03h)
Sector 1	04h – 06h	07h	
Sector 30	78h – 7Ah	7Bh	
Sector 31	7Ch – 7Eh	7Fh	

	Trailer Block (1 block, 16 bytes)	Data Blocks (15 blocks, 16 bytes per block)	Sectors (Total 8 sectors. Each sector consists of 16 consecutive blocks)
_	8Fh	80h – 8Eh	Sector 32
	9Fh	90h – 9Eh	Sector 33
	EFh	E0h – EEh	Sector 38
	FFh	F0h – FEh	Sector 39

Table 11: MIFARE® Classic 4K Memory Map

Byte Number	0	1	2	3	Page
Serial Number	SN0	SN1 SN2		BCC0	0
Serial Number	SN3	SN4	SN5	SN6	1
Internal/Lock	BCC1	Internal	Lock0	Lock1	2
OTP	OPT0	OPT1	OTP2	OTP3	3

or 64 bytes

512 bits

Table 12: MIFARE® Ultralight® Memory Map

Examples:

```
// To authenticate the Block 04h with a {TYPE A, key number 00h}. PC/SC V2.01, Obsolete APDU = \{FF 88 00 04 60 00h\};
```

```
// To authenticate the Block 04h with a {TYPE A, key number 00h}. PC/SC V2.07 
 APDU = \{FF 86 00 00 05 01 00 04 60 00h\}
```

Note: MIFARE Ultralight does not need to do any authentication. The memory is free to access.

6.4.3. Read Binary Blocks

This command retrieves a multiple of "data blocks" from the PICC. The data block/trailer block must be authenticated first before executing this command.

Read Binary APDU Format (5 bytes)

Command	Class	INS	P1	P2	Le
Read Binary Blocks	FFh	B0h	00h	Block Number	Number of Bytes to Read

Where:

Block Number 1 byte. The starting block.

Number of Bytes to Read 1 byte.

Multiple of 16 bytes for MIFARE Classic (1K/4K) or Multiple

of 4 bytes for MIFARE Ultralight

Maximum of 16 bytes for MIFARE Ultralight.

Maximum of 48 bytes for MIFARE Classic 1K. (Multiple

Blocks Mode; 3 consecutive blocks)

Maximum of 240 bytes for MIFARE Classic 4K. (Multiple

Blocks Mode; 15 consecutive blocks)

Example 1: 10h (16 bytes). Starting block only. (Single Block Mode)

Example 2: 40h (64 bytes). From the starting block to starting block+3. (Multiple Block Mode)

Note: For security reasons, the Multiple Block Mode is used for accessing Data Blocks only. The Trailer Block is not supposed to be accessed in Multiple Blocks Mode. Please use Single Block Mode to access the Trailer Block.

Read Binary Block Response Format (Multiply of 4/16 + 2 bytes)

Response	Data Out					
Result	Data (Multiple of 4/16 bytes)	SW1	SW2			

Read Binary Block Response Codes

Results	SW1	SW2	Meaning		
Successful	90h	00h	The operation is completed successfully.		
Error	63h	00h	The operation is failed.		

Examples:

// Read 16 bytes from the binary block 04h (MIFARE Classic 1K/ 4K)

APDU = FF B0 00 04 10h

// Read 240 bytes starting from the binary block 80h (MIFARE Classic 4K)

// Block 80h to Block 8Eh (15 blocks)

APDU = FF B0 00 80 F0h

6.4.4. Update Binary Blocks

This command writes a multiple of "data blocks" into the PICC. The data block/trailer block must be authenticated first before executing this command.

Update Binary APDU Format (Multiple of 16 + 5 bytes)

Command	Class	INS	P1	P2	Lc	Data In
Update Binary Blocks	FFh	D6h	00h	Block Number	Number of bytes to update	Block Data (Multiple of 16 bytes)

Where:

Block Number

1 byte. The starting block to be updated.

Number of bytes to update

1 byte.

- Maximum 16 bytes for MIFARE Classic (1K/4K) or 4 bytes for MIFARE Ultralight.
- Maximum 48 bytes for MIFARE Classic 1K. (Multiple Blocks Mode; 3 consecutive blocks)
- Maximum 240 bytes for MIFARE Classic 4K. (Multiple Blocks Mode; 15 consecutive blocks)

Block Data

Multiple of 16 + 2 bytes, or 6 bytes. The data to be written into the binary block/blocks.

Example 1: 10h (16 bytes). The starting block only. (Single Block Mode)

Example 2: 30h (48 bytes). From the starting block to starting block +2. (Multiple Block Mode)

Note: For safety reasons, the Multiple Block Mode is used for accessing data blocks only. The Trailer Block is not supposed to be accessed in Multiple Blocks Mode. Please use Single Block Mode to access the Trailer Block.

Update Binary Block Response Codes (2 bytes)

Results	SW1	SW2	Meaning		
Successful	90h	00h	The operation is completed successfully.		
Error	63h	00h	The operation is failed.		

Examples:

// Update the binary block 04h of MIFARE Classic (1K/4K) with Data {00 01 .. 0Fh}

APDU = FF D6 00 04 10 00 01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0Fh

// Update the binary block 04h of MIFARE Ultralight with Data {00 01 02 03h}

APDU = FF D6 00 04 04 00 01 02 03h

6.4.5. Value Block Operation (INC, DEC, STORE)

This command manipulates value-based transactions (e.g., increment a value of the value block).

Value Block Operation APDU Format (10 bytes)

Command	Class	INS	P1	P2	Lc		Data In
Value Block Operation	FFh	D7h	00h	Block Number	05h	VB_OP	VB_Value (4 bytes) {MSB LSB}

Where:

Block Number 1 byte. The value block to be manipulated.

VB_OP 1 byte.

00h = Store the VB_Value into the block. The block will then be

converted to a value block.

01h = Increment the value of the value block by the VB_Value. This

command is only valid for value block.

02h = Decrement the value of the value block by the VB_Value. This

command is only valid for value block.

VB_Value 4 bytes. The value used for value manipulation. The value is a signed

long integer (4 bytes).

Example 1: Decimal –4 = {FFh, FFh, FFh, FCh}

VB_Value						
MSB	MSB LSB					
FFh	FFh	FFh	FCh			

Example 2: Decimal 1 = {00h, 00h, 00h, 01h}

VB_Value					
MSB LSB					
00h	00h	00h	01h		

Value Block Operation Response Format (2 bytes)

Response	Data Out	
Result	SW1	SW2

Value Block Operation Response Codes

Results	SW1	SW2	Meaning
Successful	90h	00h	The operation is completed successfully.
Error	63h	00h	The operation is failed.

6.4.6. Read Value Block

This command retrieves the value from the value block. This command is only valid for value block.

Read Value Block APDU Format (5 bytes)

Command	Class	INS	P1	P2	Le
Read Value Block	FFh	B1h	00h	Block Number	04h

Where:

Block Number 1 byte. The value block to be accessed.

Read Value Block Response Format (4 + 2 bytes)

Response	Data Out		
Result	Value {MSB LSB}	SW1	SW2

Where:

Value 4 bytes. The value returned from the card. The value is a signed long integer (4

bytes).

Example 1: Decimal –4 = {FFh, FFh, FFh, FCh}

Value					
MSB LSB					
FFh	FFh	FFh	FCh		

Example 2: Decimal 1 = {00h, 00h, 00h, 01h}

Value					
MSB LSB					
00h	00h	00h	01h		

Read Value Block Response Codes

Results	SW1	SW2	Meaning
Successful	90h	00h	The operation is completed successfully.
Error	63h	00h	The operation is failed.

6.4.7. Copy Value Block

This command copies a value from a value block to another value block.

Copy Value Block APDU Format (7 bytes)

Command	Class	INS	P1	P2	Lc	D	ata In
Value Block Operation	FFh	D7h	00h	Source Block Number	02h	03h	Target Block Number

Where:

Source Block Number 1 byte. The value of the source value block will be copied to the

target value block.

Target Block Number 1 byte. The value block to be restored. The source and target

value blocks must be in the same sector.

Copy Value Block Response Format (2 bytes)

Response	Data Out	
Result	SW1	SW2

Copy Value Block Response Codes

Results	SW1	SW2	Meaning
Successful	90h	00h	The operation is completed successfully.
Error	63h	00h	The operation is failed.

Examples:

// Store a value "1" into block 05h

APDU = FF D7 00 05 05 00 00 00 00 01h

// Read the value block 05h

APDU = FF B1 00 05 04h

// Copy the value from value block 05h to value block 06h

APDU = FF D7 00 05 02 03 06h

// Increment the value block 05h by "5"

APDU = FF D7 00 05 05 01 00 00 00 05h

6.5. Accessing PC/SC-compliant tags (ISO 14443-4)

All ISO 14443-4 compliant cards (PICCs) understand the ISO 7816-4 APDUs. ACR1255U-J1 just has to communicate with the ISO 14443-4 compliant cards through exchanging ISO 7816-4 APDUs and responses. ACR1255U-J1 will handle the ISO 14443 Parts 1-4 Protocols internally.

MIFARE Classic (1K/4K), MIFARE Mini and MIFARE Ultralight tags are supported through the T=CL emulation. Just simply treat the MIFARE tags as standard ISO 14443-4 tags. For more information, please refer to **PICC Commands for MIFARE® Classic (1K/4K) memory cards**.

ISO 7816-4 APDU Format

Command	Class	INS	P1	P2	Lc	Data In	Le
ISO 7816 Part 4 Command					Length of the Data In		Expected length of the Response Data

ISO 7816-4 Response Format (Data + 2 bytes)

Response	Data Out						
Result	Response Data	SW1	SW2				

Common ISO 7816-4 Response Codes

Results	SW1	SW2	Meaning
Successful	90h	00h	The operation is completed successfully.
Error	63h	00h	The operation is failed.

Typical sequence may be:

- 1. Present the tag and connect the PICC Interface.
- 2. Read/Update the memory of the tag.

To do this:

1. Connect the tag.

The ATR of the tag is 3B 88 80 01 00 00 00 00 33 81 81 00 3Ah.

Wherein:

Application Data of ATQB = 00 00 00 00

Protocol information of ATQB = 33 81 81.

It is an ISO 14443-4 Type B tag.

2. Send an APDU, Get Challenge.

<< 00 84 00 00 08h

>> 1A F7 F3 1B CD 2B A9 58h [90 00h]

Note: For ISO 14443-4 Type A tags, the ATS can be obtained by using the APDU "FF CA 01 00 00h."

Example:

// Read 8 bytes from an ISO 14443-4 Type B PICC (ST19XR08E)

APDU = 80 B2 80 00 08h

Class = 80h

INS = B2h

P1 = 80h

P2 = 00h

Lc = None

Data In = None

Le = 08h

Answer: 00 01 02 03 04 05 06 07h [\$9000h]

6.6. Peripherals Control

The reader's peripherals control commands are implemented through PC_to_RDR_Escape.

Command Format

Offset	Field	Size	Value	Description
0	bMessageType	1	6Bh	-
1	dwLength	4	-	Size of abData field of this message
5	bSlot	1	-	Identifies the slot number for this command
6	bSeq	1	-	Sequence number for command
7	abRFU	3	-	Reserved for Future Use
10	abData	Byte array	-	Data block sent to the CCID

6.6.1. Get Firmware Version

This command gets the reader's firmware message.

Get Firmware Version Format (5 bytes)

Command	Class	INS	P1	P2	Lc
Get Firmware Version	E0h	00h	00h	18h	00h

Get Firmware Version Response Format (5 bytes + Firmware Message Length)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	Number of bytes to receive	Firmware Version

Example:

Response = E1 00 00 00 14 41 43 52 31 32 35 35 55 2D 4A 31 20 53 57 56 20 31 2E 30 35

Firmware Version (HEX) = 41 43 52 31 32 35 35 55 2D 4A 31 20 53 57 56 20 31 2E 30 35

Firmware Version (ASCII) = "ACR1255U-J1 SWV 1.05"

6.6.2. Get Serial Number

This command gets the reader's serial number.

Get Serial Number Format (5 bytes)

Command	Class	INS	P1	P2	Lc
Get Serial Number	E0h	00h	00h	47h	00h

Get Serial Number Response Format (N bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	Number of bytes to be Received	Serial Number

Example:

Response = E1 00 00 00 0C 52 52 33 33 30 2D 30 30 30 30 31 36

Serial Number (HEX) = 52 52 33 33 30 2D 30 30 30 30 31 36

Serial Number (ASCII) = "RR330-000016"

6.6.3. LED Control (in USB Mode only)

This command controls the LED's output.

LED Control Format (6 bytes)

Command	Class	INS	P1	P2	Lc	Data In
LED Control	E0h	00h	00h	29h	01h	LED Status

LED Control Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	LED Status

LED Status (1 byte)

LED Status	LED	Color	Description
Bit 0	1	GREEN	1 = ON; 0 = OFF
Bit 1	1	RED	1 = ON; 0 = OFF
Bit 2	2	BLUE	1 = ON; 0 = OFF
Bit 3	2	RED	1 = ON; 0 = OFF
Bit 4 - 7	-	RFU	RFU

6.6.4. LED Status

This command checks for the existing LED's status.

LED Status Format (5 bytes)

Command	Class	INS	P1	P2	Lc
LED Status	E0h	00h	00h	29h	00h

LED Status Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	LED Status

LED Status (1 byte)

LED Status	LED	Color	Description
Bit 0	1	GREEN	1 = ON; 0 = OFF
Bit 1	1	RED	1 = ON; 0 = OFF
Bit 2	2	GREEN	1 = ON; 0 = OFF
Bit 3	2	RED	1 = ON; 0 = OFF
Bit 4 - 7	-	RFU	RFU

6.6.5. Buzzer Control

This command controls the buzzer output.

Buzzer Control Format (6 bytes)

Command	Class	INS	P1	P2	Lc	Data In
Buzzer Control	E0h	00h	00h	28h	01h	Buzzer On Duration

Where:

Buzzer On Duration 1 byte

00h = Turn OFF

01 to FFh = Duration (unit: 10 ms)

Buzzer Control Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	00h

6.6.6. Set LED and Buzzer Status Indicator Behavior

This command sets the behaviors of LEDs and buzzer as status indicators.

Set LED and Buzzer Status Indicator Behavior Format (6 bytes)

Command	Class	INS	P1	P2	Lc	Data In
Set LED and Buzzer Status Indicator Behavior	E0h	00h	00h	21h	01h	Default Behavior

Behavior (1 byte)

Behavior	Mode	Description
Bit 0	Battery Charging Status LED	To show Battery Charging Status. 1 = Enabled; 0 = Disabled
Bit 1	PICC Polling Status LED	To show the PICC Polling Status. 1 = Enabled; 0 = Disabled
Bit 2	PICC Activation Status LED	To show the activation status of the PICC interface 1 = Enabled; 0 = Disabled
Bit 3	Card Insertion and Removal Events Buzzer	To make a beep whenever a card insertion or removal event is detected. 1 = Enabled; 0 = Disabled
Bit 4 – 6	RFU	RFU
Bit 7	Card Operation Blinking LED	To light up the LED whenever the card is being accessed

Note: Default value of behavior = 8Fh.

Set LED and Buzzer Status Indicator Behavior Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	Default Behavior

6.6.7. Read LED and Buzzer Status Indicator Behavior

This command reads the current default behaviors of LEDs and buzzer.

Read LED and Buzzer Status Indicator Behavior Format (5 bytes)

Command	Class	INS	P1	P2	Lc
Read LED and Buzzer Status Indicator Behavior	E0h	00h	00h	21h	00h

Read LED and Buzzer Status Indicator Behavior Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	Behavior

Behavior (1 byte)

Behavior	Mode	Description
Bit 0	Battery Charging Status LED	To show Battery Charging Status. 1 = Enabled; 0 = Disabled
Bit 1	PICC Polling Status LED	To show the PICC Polling Status. 1 = Enabled; 0 = Disabled
Bit 2	PICC Activation Status LED	To show the activation status of the PICC interface 1 = Enabled; 0 = Disabled
Bit 3	Card Insertion and Removal Events Buzzer	To make a beep whenever a card insertion or removal event is detected. 1 = Enabled; 0 = Disabled
Bit 4 – 6	RFU	RFU
Bit 7	Card Operation Blinking LED	To light up the LED whenever the card is being accessed

Note: Default value of Behavior = 8Fh.

6.6.8. Set Automatic PICC Polling

This command sets the reader's polling mode.

Whenever the reader is connected to the computer, the PICC polling function will start the PICC scanning to determine if a PICC is placed on/removed from the built-antenna.

A command may be sent to disable the PICC polling function. The command is sent through the PC/SC Escape command interface. To meet the energy saving requirement, special modes are provided for turning off the antenna field whenever the PICC is inactive, or no PICC is found. The reader will consume less current in power saving mode.

Set Automatic PICC Polling Format (6 bytes)

Command	Class	INS	P1	P2	Lc	Data In
Set Automatic PICC Polling	E0h	00h	00h	23h	01h	Polling Setting

Set Automatic PICC Polling Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	Polling Setting

Polling Setting (1 byte)

Polling Setting	Mode	Description
Bit 0	Automatic PICC Polling	1 = Enabled; 0 =Disabled
Bit 1	Turn off Antenna Field if no PICC found	1 = Enabled; 0 =Disabled
Bit 2	Turn off Antenna Field if the PICC is inactive	1 = Enabled; 0 =Disabled
Bit 3	Activate the PICC when detected.	1 = Enabled; 0 =Disabled
Bit 5 4	PICC Poll Interval for PICC	<bit -="" 4="" 5="" bit=""> <0 - 0> = 250 ms <0 - 1> = 500 ms <1 - 0> = 1000 ms <1 - 1> = 2500 ms</bit>
Bit 6	RFU	-
Bit 7	Enforce ISO 14443A Part 4	1= Enabled; 0= Disabled

Note: Default value of Polling Setting = 8Fh.

Reminders:

1. It is recommended to enable the option "Turn Off Antenna Field if the PICC is inactive", so that the "Inactive PICC" will not be exposed to the field all the time to prevent the PICC from "warming up".

2. The longer the PICC poll interval, the more efficient the energy saving will be. However, the response time of PICC Polling will become longer. The Idle Current Consumption in Power Saving Mode is about 60 mA, while the Idle Current Consumption in Non-Power Saving mode is about 130mA.

Note: Idle Current Consumption = PICC is not activated.

- 3. The reader will activate the ISO 14443A-4 mode of the "ISO 14443A-4 compliant PICC" automatically. Type B PICC will not be affected by this option.
- 4. The JCOP30 card comes with two modes: ISO 14443A-3 (MIFARE Classic 1K) and ISO 14443A-4 modes. The application has to decide which mode should be selected once the PICC is activated.

6.6.9. Read Automatic PICC Polling

This command checks the current PICC polling setting.

Read Automatic PICC Polling Format (5 bytes)

Command	Class	INS	P1	P2	Lc
Read Automatic PICC Polling	E0h	00h	00h	23h	00h

Read the Configure Mode Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	Polling Setting

Polling Setting (1 byte)

Polling Setting	Mode	Description
Bit 0	Automatic PICC Polling	1 = Enabled; 0 =Disabled
Bit 1	Turn off Antenna Field if no PICC found	1 = Enabled; 0 =Disabled
Bit 2	Turn off Antenna Field if the PICC is inactive	1 = Enabled; 0 =Disabled
Bit 3	Activate the PICC when detected	1 = Enabled; 0 =Disabled
Bit 5 4	PICC Poll Interval for PICC	<bit -="" 4="" 5="" bit=""> <0 - 0> = 250 ms <0 - 1> = 500 ms <1 - 0> = 1000 ms <1 - 1> = 2500 ms</bit>
Bit 6	RFU	-
Bit 7	Enforce ISO 14443A Part 4	1= Enabled; 0= Disabled

Note: Default value of Polling Setting = 8Fh.

6.6.10. Set PICC Operating Parameter

This command sets the PICC operating parameter.

Set the PICC Operating Parameter Format (6 bytes)

Command	Class	INS	P1	P2	Lc	Data In
Set the PICC Operating Parameter	E0h	00h	00h	20h	01h	Operation Parameter

Set the PICC Operating Parameter Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1	00h	00h	00h	01h	Operation Parameter

Operating Parameter (1 byte)

Operating Parameter	Parameter	Description	Option
Bit 0	ISO 14443 Type A		1 = Detect 0 = Skip
Bit 1	ISO 14443 Type B		1 = Detect 0 = Skip
Bit 2	FeliCa 212 Kbps	The Tag Types to be detected during PICC Polling.	1 = Detect 0 = Skip
Bit 3	FeliCa 424 Kbps		1 = Detect 0 = Skip
Bit 4	Topaz		1 = Detect 0 = Skip
Bit 5 - 7	RFU	RFU	RFU

Note: Default value of Operation Parameter = 1Fh.

6.6.11. Read PICC Operating Parameter

This command checks the current PICC operating parameter.

Read the PICC Operating Parameter Format (5 bytes)

Command	Class	INS	P1	P2	Lc
Read the PICC Operating Parameter	E0h	00h	00h	20h	00h

Read the PICC Operating Parameter Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	Operation Parameter

Operating Parameter (1 byte)

Operating Parameter	Parameter	Description	Option
Bit 0	ISO 14443 Type A		1 = Detect 0 = Skip
Bit 1	ISO 14443 Type B		1 = Detect 0 = Skip
Bit 2	FeliCa	The Tag Types to be detected during PICC Polling.	1 = Detect 0 = Skip
Bit 3	FeliCa 424 Kbps		1 = Detect 0 = Skip
Bit 4	Topaz		1 = Detect 0 = Skip
Bit 5 - 7	RFU	RFU	RFU

Note: Default value of Operation Parameter = 1Fh.

6.6.12. Set Auto PPS

Whenever a PICC is recognized, the reader will try to change the communication speed between the PCD and PICC defined by the maximum connection speed. If the card does not support the proposed connection speed, the reader will try to connect the card with a slower speed setting.

Set Auto PPS Format (7 bytes)

Command	Class	INS	P1	P2	Lc	Data In		
Set Auto PPS	E0h	00h	00h	24h	02h	Max Tx Speed	Max Rx Speed	

Set Auto PPS Response Format (9 bytes)

Response	Class	INS	P1	P2	Le	Data Out			
Result	E1h	00h	00h	00h	04h	Max Tx Speed	Current Tx Speed		Current Rx Speed

Where:

Max Tx Speed1 byte. Maximum Transmission Speed.Max Rx Speed1 byte. Maximum Receiving Speed.Current Tx Speed1 byte. Current Transmission Speed.Current Rx Speed1 byte. Current Receiving Speed.

Value can be: 00h = 106 Kbps

01h = 212 Kbps

02h = 424 Kbps

Note: Default setting is 00h.

Notes:

- Normally, the application should be able to know the maximum connection speed of the PICCs being used. The environment can also affect the maximum achievable speed. The reader uses the proposed communication speed to exchange information with the PICC. The PICC will become inaccessible if the PICC or the environment does not meet the requirement of the proposed communication speed.
- 2. The reader supports different speed between sending and receiving.

6.6.13. Read Auto PPS

This command checks the current Auto PPS Setting.

Read Auto PPS Format (5 bytes)

Command	Class	INS	P1	P2	Lc
Read Auto PPS	E0h	00h	00h	24h	00h

Set Auto PPS Response Format (9 bytes)

Response	Class	INS	P1	P2	Le	Data Out			
Result	E1	00h	00h	00h	04h	Max Tx Speed	Current Tx Speed	Max Rx Speed	Current Rx Speed

Where:

Max Tx Speed1 byte. Maximum Transmission Speed.Max Rx Speed1 byte. Maximum Receiving Speed.Current Tx Speed1 byte. Current Transmission Speed.Current Rx Speed1 byte. Current Receiving Speed.

Value can be: 00h = 106 Kbps

01h = 212 Kbps

02h = 424 Kbps

Note: Default setting is 00h.

6.6.14. Antenna Field Control

This command turns on/off the antenna field.

Antenna Field Control Format (6 bytes)

Command	Class	INS	P1	P2	Lc	Data In
Antenna Field Control	E0h	00h	00h	25h	01h	Status

Antenna Field Control Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	Status

Where:

Status 1 byte.

01h = Enable Antenna Field00h = Disable Antenna Field

Note: Make sure the Auto PICC Polling is disabled before turning off the antenna field.

6.6.15. Read Antenna Field Status

This command checks the current Antenna Field Status.

Read Antenna Field Status Format (5 bytes)

Command	Class	INS	P1	P2	Lc
Read Antenna Field Status	E0h	00h	00h	25h	00h

Read Antenna Field Status Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	Status

Where:

Status 1 byte.

00h = PICC Power Off

01h = PICC Idle [Ready to Poll Contactless Tag, but not detected]

02h = PICC Ready [PICC Request (Ref to ISO 14443) Successful, i.e.

Contactless Tag Detected]

03h = PICC Selected [PICC Select (Ref to ISO 14443) Successful]

04h = PICC Activate [PICC Activation (Ref to ISO 14443) Successful, Ready for

APDU Exchange]

6.6.16. Sleep Mode Option

By default, the reader will enter the sleep mode if there is no operation for 60 seconds.

This command sets the time interval before entering sleep mode.

Set Sleep Time Interval Format (5 bytes)

Command	Class	INS	P1	P2	Lc
Set Sleep Time Interval	E0h	00h	00h	48h	Time

Set Sleep Time Interval Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	Time

Where:

Time 1 byte

00h = 60 seconds

01h = 90 seconds

02h = 120 seconds

03h = 180 seconds

04h = Disable

6.6.17. Change Tx Power command

This command sets the Bluetooth transmission power.

Set Tx Power Format (5 bytes)

Command	Class	INS	P1	P2	Lc
Set Tx power	E0h	00h	00h	49h	Tx Power

Set Tx Power Response Format (5 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	Tx Power

Where:

Tx Power 1 byte

00h = -23 dBm (default)

01h = -6 dBm

02h = 0 dBm

03h = 4 dBm

6.6.18. Read Tx Power Value

This command checks the Bluetooth transmission power.

Read Tx Power Value Format (5 bytes)

Command	Class	INS	P1	P2	Lc
Set Tx power	E0h	00h	00h	50h	00h

Read Tx Power Value Response Format (6 bytes)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	01h	Tx Power

Where:

Tx Power 1 byte

00h = -23 dBm (default)

01h = -6 dBm

02h = 0 dBm

03h = 4 dBm

6.6.19. Customer Master Key Rewrite

This commands set the customer master key.

Customer Master Key reset command format (5 bytes)

Command	Class	INS	P1	P2	Lc
Customer Master Key reset	E0h	00h	00h	60h	00h

Customer Master Key reset Response format (21 bytes) (successful)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	10h	16 bytes random numbers

Customer Master Key rewrite command format (36 bytes)

Command	Class	INS	P1	P2	Lc
Customer Master Key rewrite	E0h	00h	00h	61h	16 bytes encrypted random numbers + 16 bytes encrypted New Master Key

Customer Master Key rewrite Response format (7 bytes) (successful)

Response	Class	INS	P1	P2	Le	Data Out
Result	E1h	00h	00h	00h	02h	90 00h

Customer Master Key rewrite Response format (5 bytes) (failed)

Response	Class	INS	P1	P2	Le
Result	E1h	00h	00h	00h	00h

Example: To rewrite customer master key.

The random number generated by the reader is "11 22 33 44 55 66 77 88 99 00 11 22 33 44 55 66"

Peer → Reader: (Customer Master Key Reset Request)

Frame1 "E0 00 00 60 00"

Reader → Peer: (Customer Master Key Reset Command Response)

Frame1 "E1 00 00 00 10 11 22 33 44 55 66 77 88 99 00 11 22 33 44 55 66"

Peer → Reader: (Rewrite Master Key Command Request)

XX XX XX XX XX"

Reader → Peer: (Rewrite Master Key Command Response)

Frame1 "E1 00 00 00 02 90 00"

Response	Description		
E1 00 00 00 02 90 00	Successful		
E1 00 00 00 00	Failed		

Appendix A. Access MIFARE DESFire tags (ISO 14443-3)

MIFARE DESFire supports ISO 7816-4 APDU Wrapping and Native modes. Once the MIFARE DESFire tag is activated, the first APDU command sent to the MIFARE DESFire tag will determine the "Command Mode". If the first APDU is in "Native Mode", the rest of the APDU commands must be in "Native Mode" format. Similarly, if the first APDU is "ISO 7816-4 APDU Wrapping Mode", the rest of the APDUs must be in "ISO 7816-4 APDU Wrapping Mode" format.

Example 1: MIFARE DESFire ISO 7816-4 APDU Wrapping.

// To read 8 bytes random number from an ISO 14443-4 Type A PICC (MIFARE DESFire) APDU = {90 0A 00 00 01 00 00}

Class = 90h; INS = 0Ah (MIFARE DESFire Instruction); P1 = 00h; P2 = 00h

Lc = 01h; Data In = 00h; Le = 00h (Le = 00h for maximum length)

Answer: 7B 18 92 9D 9A 25 05 21 [\$91AF]

Status Code {91 AF} is defined in MIFARE DESFire specification. Please refer to the MIFARE DESFire specification for more details.

Example 2: MIFARE DESFire Frame Level Chaining (ISO 7816 wrapping mode)

// In this example, the application has to do the "Frame Level Chaining".

// To get the version of the MIFARE DESFire card.

Step 1: Send an APDU {90 60 00 00 00} to get the first frame. INS=60h

Answer: 04 01 01 00 02 18 05 91 AF [\$91AF]

Step 2: Send an APDU {90 AF 00 00 00} to get the second frame. INS=AFh

Answer: 04 01 01 00 06 18 05 91 AF [\$91AF]

Step 3: Send an APDU {90 AF 00 00 00} to get the last frame. INS=AFh

Answer: 04 52 5A 19 B2 1B 80 8E 36 54 4D 40 26 04 91 00 [\$9100]
